Abstract

Within the project 'Digitalisering Overheden' (=Data Driven Government) a dashboard framework was developed to show quality indicators for several datastreams for which NDW (National Data Warehouse) has the responsibility to deliver the information. The dashboard framework is available via:

https://dashboards.ndw.nu/dashboard/digitalisering-overheden/ndw-algemene-landingspagina.

Screenshots are attached below.

Also a number of quality indicators has been developed and are now updated every month. This is done for dynamic maximum speeds (MSI), bridge openings, parking information, intelligent traffic lights (iVRI), logistics (environmental zones, safety zones, ..) and bicycle counts.

All this information is made accessible to all the road authority institutions in the Netherlands.

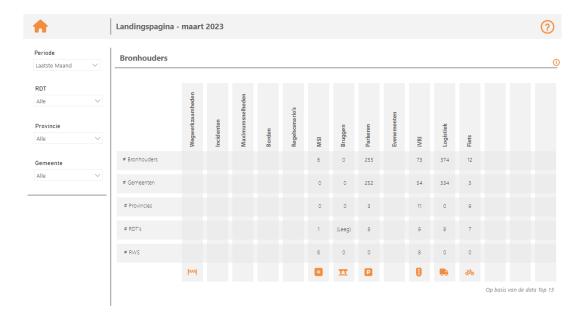

The information is used by the road authorities to increase the data quality of the distributed data, so that it can be safely used in car to assist the driver. The data is also used to assess whether the data quality is good enough to be used for policy making and monitoring.
